

# How many black dots do you see in this picture?

Why are the white and black dots difficult to count?

What happens when you focus on a single dot?

Why do think this is called the “black dot illusion?”

# This is an Optical Illusion

It is true your brain is producing the results that are not true in this optical illusion. You will find that the black dots keep appearing and disappearing as you move your eyes through the image.

There are no black dots at all, the dots are all white.

This is just a perception in your mind.
