

In the Kingdom of Trafalgeron, King Darius became the proud father of twin girls. So pleased was he with his new daughters, he decides the kingdom would be better off with more girls than boys. So he makes the following decree: "All child-bearing couples must continue to bear children until they have a daughter."

To avoid overpopulation, he makes an additional decree: "All child-bearing couples will stop having children once they have a daughter."

If the likelihood of having a girl is 50%, after many years, what's the expected ratio of girls to boys in Trafalgeron?

If the likelihood of having a girl is 50%, after many years, what’s the expected ratio of girls to boys in Trafalgeron?

1:1 The easiest way to figure this out is to start with a small population and write out the possibilities. The pattern should start to emerge.

# Couples	boys	girls
64	32	32
32	16	16
16	8	8
8	4	4
